

[Special cups with support]

Designed and manufactured for the purpose of handling stamped or drawn plates, these cups are used predominately in the motor field.

They have a ground lip, which permits an immediate grip of the load to be lifted as soon as contact is made and assures a perfect vacuum seal.

These cups are produced in a special compound called BENZ, able to withstand chlorine usually contained in the oils for the stamping and drawing of plates.

The support is zinc-plated steel and is vulcanized on the cup.

They are available in the three series of compounds.
